

Author roles: General properties

This documentation shows you the author role management options on the General Properties tab.

A new author role is defined in the following manner.

General properties

The first section is for defining the general properties – title and technical name – of the author role. These fields are mandatory. The other settings on the Properties tab include:

Login

The first authorizations that have to be defined involve the login to the components of the knowledge force. Every author role is authorized to log in to both the Curator and the WebAccess (portal) by default. You can also specify that the workspace is to be opened by default whenever authors switch over to the "Curator" perspective.

The settings for the role selection screen allow you to specify whether a user with this author role is to land on the start screen in which they can select the desired role (e.g. author, translator... or "All roles") and whether the current author role is to be included in this selection screen.

Content transports

This is where you can grant users the right to import data via content distribution packages or an Excel import into the Curator and export data from the Curator.

Document file

This section is for specifying whether a user with this role is to have access to the function for searching and replacing object properties.

Evaluations

The bottom section of the page is for specifying whether users with this role are to have access to the reports and evaluations function.
