

Integrating external documents

This guide will show you the steps that are necessary to integrate external files into your workspace.

External files are files which are stored in the file system of your hard drive and not in tts performance suite. They include PDF, Excel, Word or video files, but also HTML files and associated resources. You can also upload these files into the Curator and use them in your processes, courses and topics.

To create an external file, start by creating a new document and then activate the **Upload File** option in Step 3 of the Wizard. You can then select the desired file.

To upload HTML files with resources, proceed in the following manner:

1. Change the name of the HTML file to "index.html". HTML files with this name will be opened after the upload.
2. Create a ZIP file from the index.html and associated resources.
3. Upload the file in Step 4 of the Wizard.

It's also possible to upload content packages (file ending: .ttcp) which were created with tts performance suite. These are recognized as Producer documents.
