

Working with lists

You work with lists in both the Document Editor and Local Workspace. Keep reading to find out more about how to display and position lists.

The **lists** available in the Document Editor and Local Workspace can be positioned **anywhere** you want, either inside or outside the document window, via drag & drop (dockable windows). Lists are opened via the **View** tab or a key combination. Lists can be hidden, minimized or maximized whenever you want.

Every list can be positioned via its associated **tab**. If the tabs are not visible, they can be shown by changing the User Preferences under "Producer".

To move a list, drag the corresponding tab to its desired new position while keeping the left mouse button pressed and then let go of the mouse button.

The mouse pointer changes into an Arrow icon when it touches the edge of an existing window. The arrow indicates where the window will be inserted. It can be positioned to the right, to the left, above or below another window.

Whenever a list is dragged next to another tab, the mouse pointer changes into a Tab icon. This icon indicates that from now on both lists will share the same window. The two tabs will then be arranged next to each other.

A special function also allows you to position a list *outside* the program window. The list then appears in a separate window which, for example, can be displayed on a second monitor. It's also possible to drag other lists into this window. If you want a list to be displayed in the program window again, simply drag it back into the program window until the mouse pointer changes into an Arrow or Tab icon.
